

This is a data report outlining the a pearson correlation analysis of viral qpcr and clinical score data in the CC lines.

This analysis is based off code documented here:

<https://www.r-bloggers.com/r-defining-your-own-color-schemes-for-heatmaps/> (<https://www.r-bloggers.com/r-defining-your-own-color-schemes-for-heatmaps/>)

```

```
set.seed(123)

oas1b_corr_plot <- read.csv(file="C:\\gale_lab\\oas1b_manuscript\\revisions\\qPCR_and_outcomes.csv", header=T)

#transpose values
m <- melt(cor(oas1b_corr_plot[,c(5:11)], use="pairwise.complete.obs"))

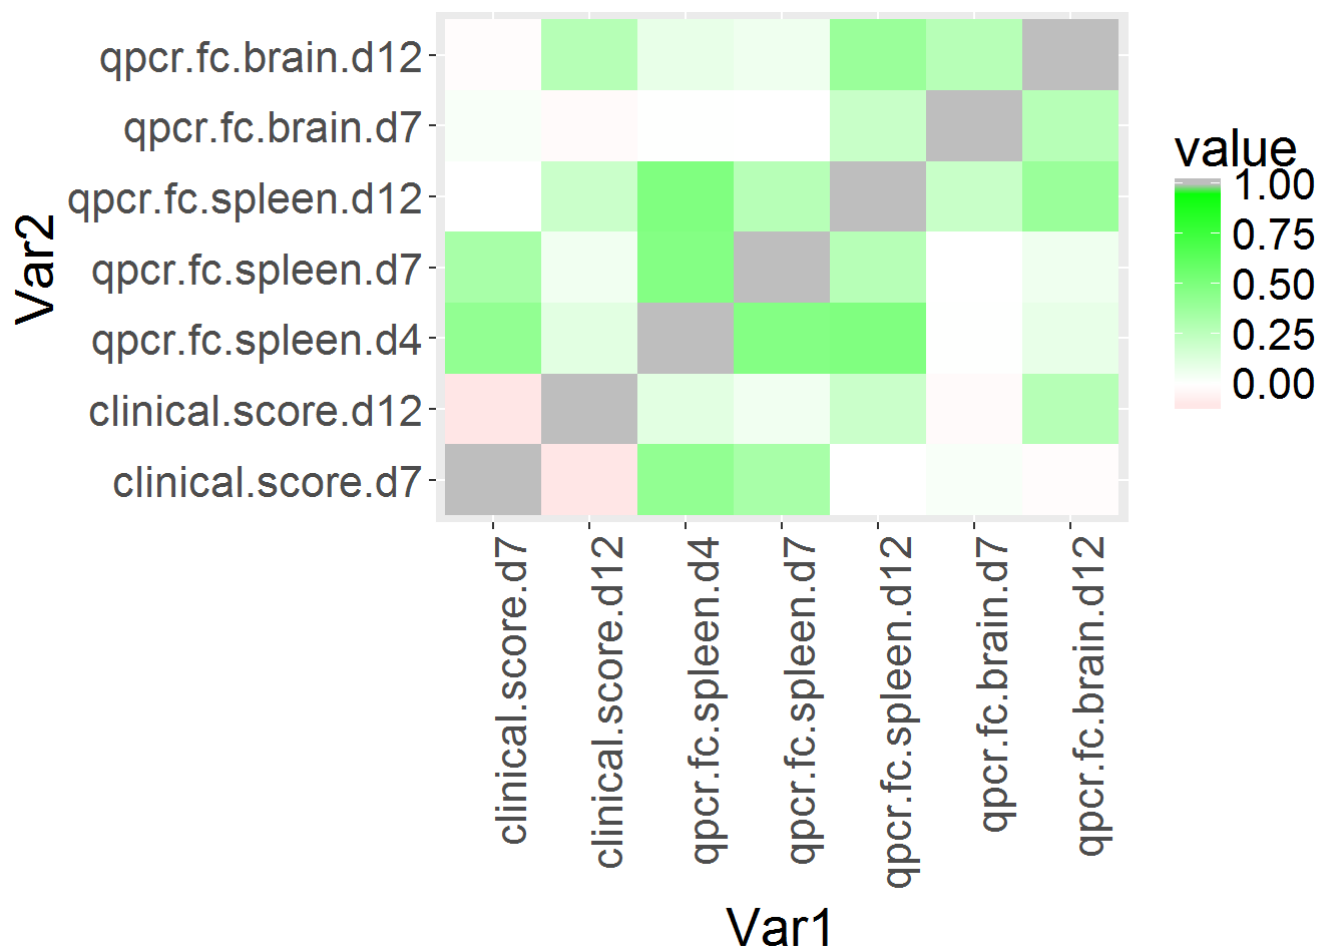

# create a correlation plot image using ggplot2
p <- ggplot(data=m, aes(x=Var1, y=Var2, fill=value)) + geom_tile() + theme(text = element_text(size=20),
axis.text.x = element_text(angle=90, hjust=1))
```

We update the color panel to show those conditions with the highest correlation.

```
#set up a coloring scheme using colorRampPalette
red=rgb(1,0,0); green=rgb(0,1,0); blue=rgb(0,0,1); white=rgb(1,1,1)
RtoWrange<-colorRampPalette(c(red, white) )
WtoGrange<-colorRampPalette(c(white, green) )

p <- p + scale_fill_gradient2(low=RtoWrange(100), mid=WtoGrange(100), high="gray")

p + theme(text = element_text(size=20),
axis.text.x = element_text(angle=90, hjust=1))
```

In the correlation heatmap above, there is a relationship between viral load and clinical score at days 4 and 7 post infection. There is also a correlation between clinical score and viral load in the brain at day 12 post infection.
